Arbuckle-Simpson Hydrology Study

- Study area
- Study overview
- Describe hydrologic concepts and define terms
- Hydrogeologic setting of the Arbuckle-Simpson aquifer
- Examples

Senate Bill 288

- Moratorium
- Conducts and completes a hydrological study
- Approves a maximum annual yield that will not reduce the natural flow of water from springs or streams emanating from the basin

State of Oklahoma
OWRB
Water Resources Board
the water agency

Purpose

To acquire sufficient understanding of the hydrology of the Arbuckle-Simpson aquifer to enable development and implementation of a comprehensive water resource management plan that protects the flow of springs and streams in the region.

State of Oklahoma
OWRB
Water Resources Board
the water agency

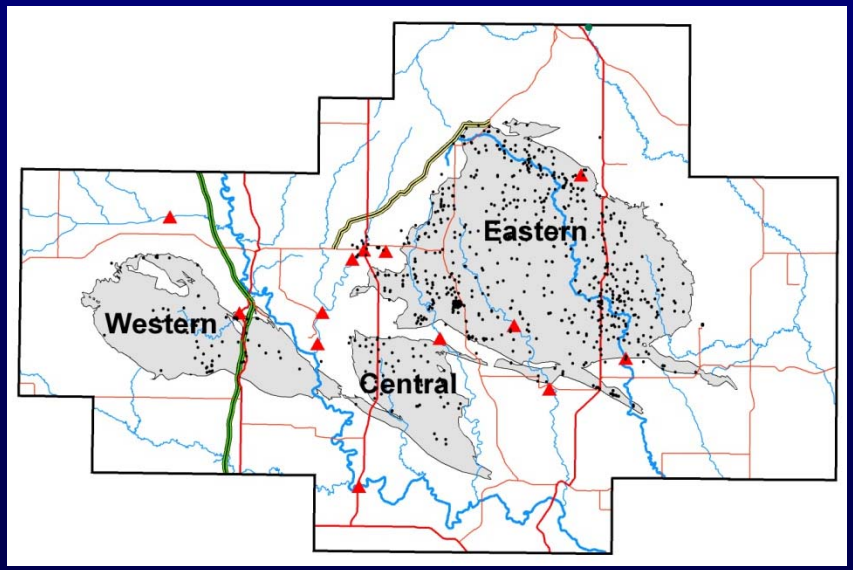
Scope of investigation

- Aquifer-scale assessment for determination of the maximum annual yield
- Information can be applied to many water management and hydrological issues (permits, water supply planning, well drilling, environmental issues)

State of Oklahoma
OWRB
Water Resources Board
the water agency

Eastern Arbuckle-Simpson Aquifer

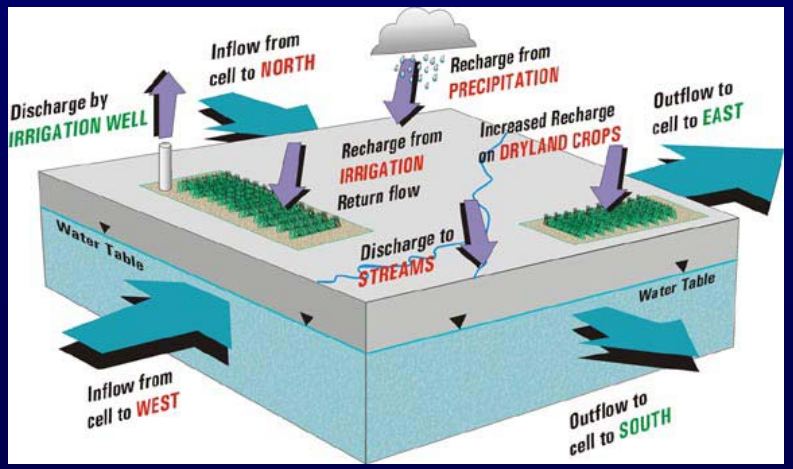
- Largest part of the aquifer
- Most of the current groundwater permits and withdrawals
- Hydrogeologic data (wells and stream gages)
- Accessible
- Budget and time constraints



State of Oklahoma
OWRB
Water Resources Board
the water agency

Digital Groundwater Flow Model

- Test our understanding of the aquifer
- Predict the consequences of groundwater withdrawals on streamflow
- Evaluate allocation of water rights
- Simulate management options



State of Oklahoma
OWRB
WATER RESOURCES BOARD
the water agency

Protection of Springs and Streams

- Approve a maximum annual yield that will not reduce the natural flow of water from springs or streams emanating from the basin.

Putting the pieces together

Geology:

- Petroleum information
- Fracture properties
- Geophysics
- Deep test well
- 3-D geologic modeling

Surface Water:

- 3 USGS gages
- Baseflow monitoring
- Rainfall-runoff modeling
- Instream flow study

Climate:

- Fittstown Mesonet station
- Hydrologic budget
- Tree-ring analysis

Ground Water:

- Water-level monitoring
- Water chemistry
- Age-dating
- Aquifer tests
- Water use
- Ground-water modeling

Hydroclimatic Reconstruction of the Arbuckle-Simpson Aquifer Using Tree Rings

Aondover Tarhule

Department of Geography

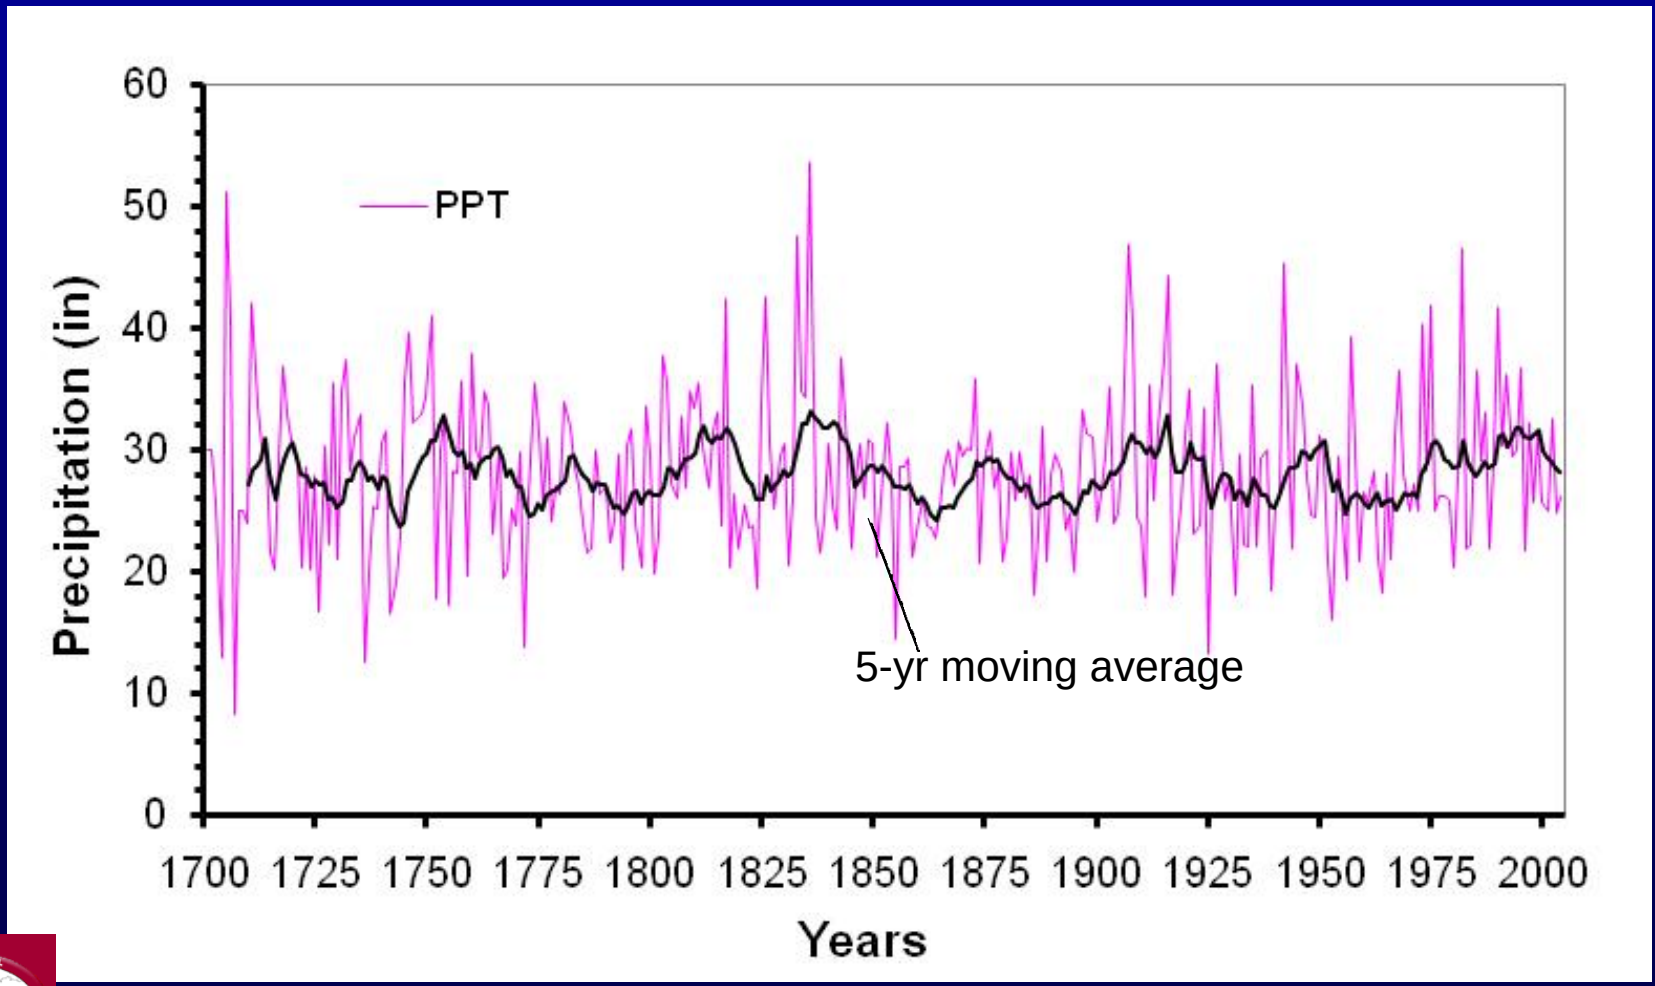
University of Oklahoma

atarhule@ou.edu

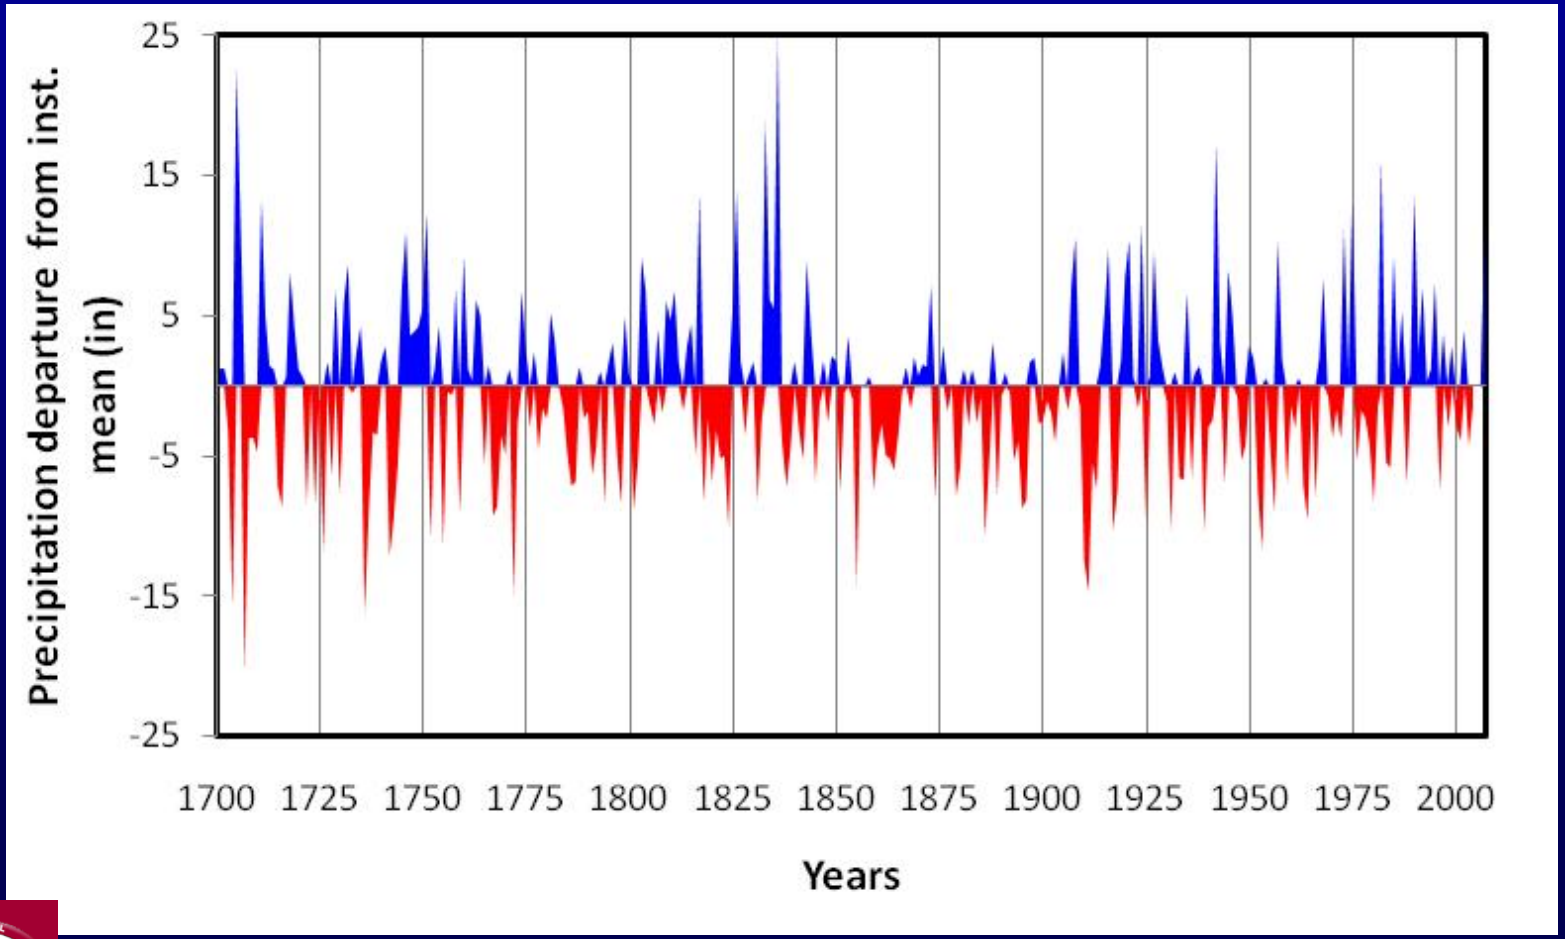
Hydroclimatic Reconstruction

- Developed a 304-year tree-ring chronology from post oak trees.
- Reconstructed precipitation and streamflow
  - to provide a longer term perspective of climatic variability than is possible with instrumental records and
  - to evaluate the risk of drought.

Reconstructed precipitation (1700-2004)



Precipitation Departure from Instrumental Mean

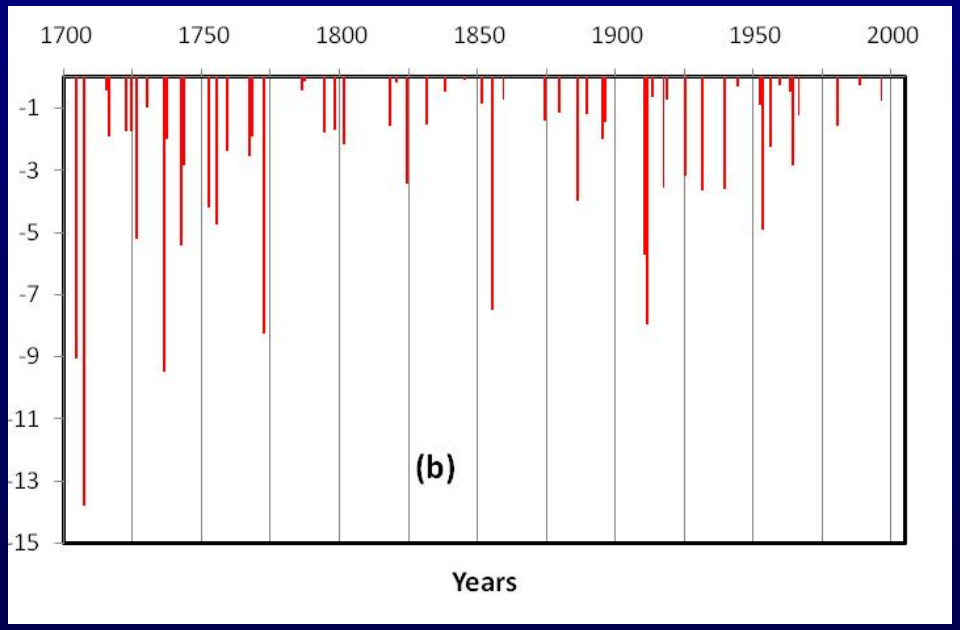


Threshold

The drought that occurs on average once every 5 years.

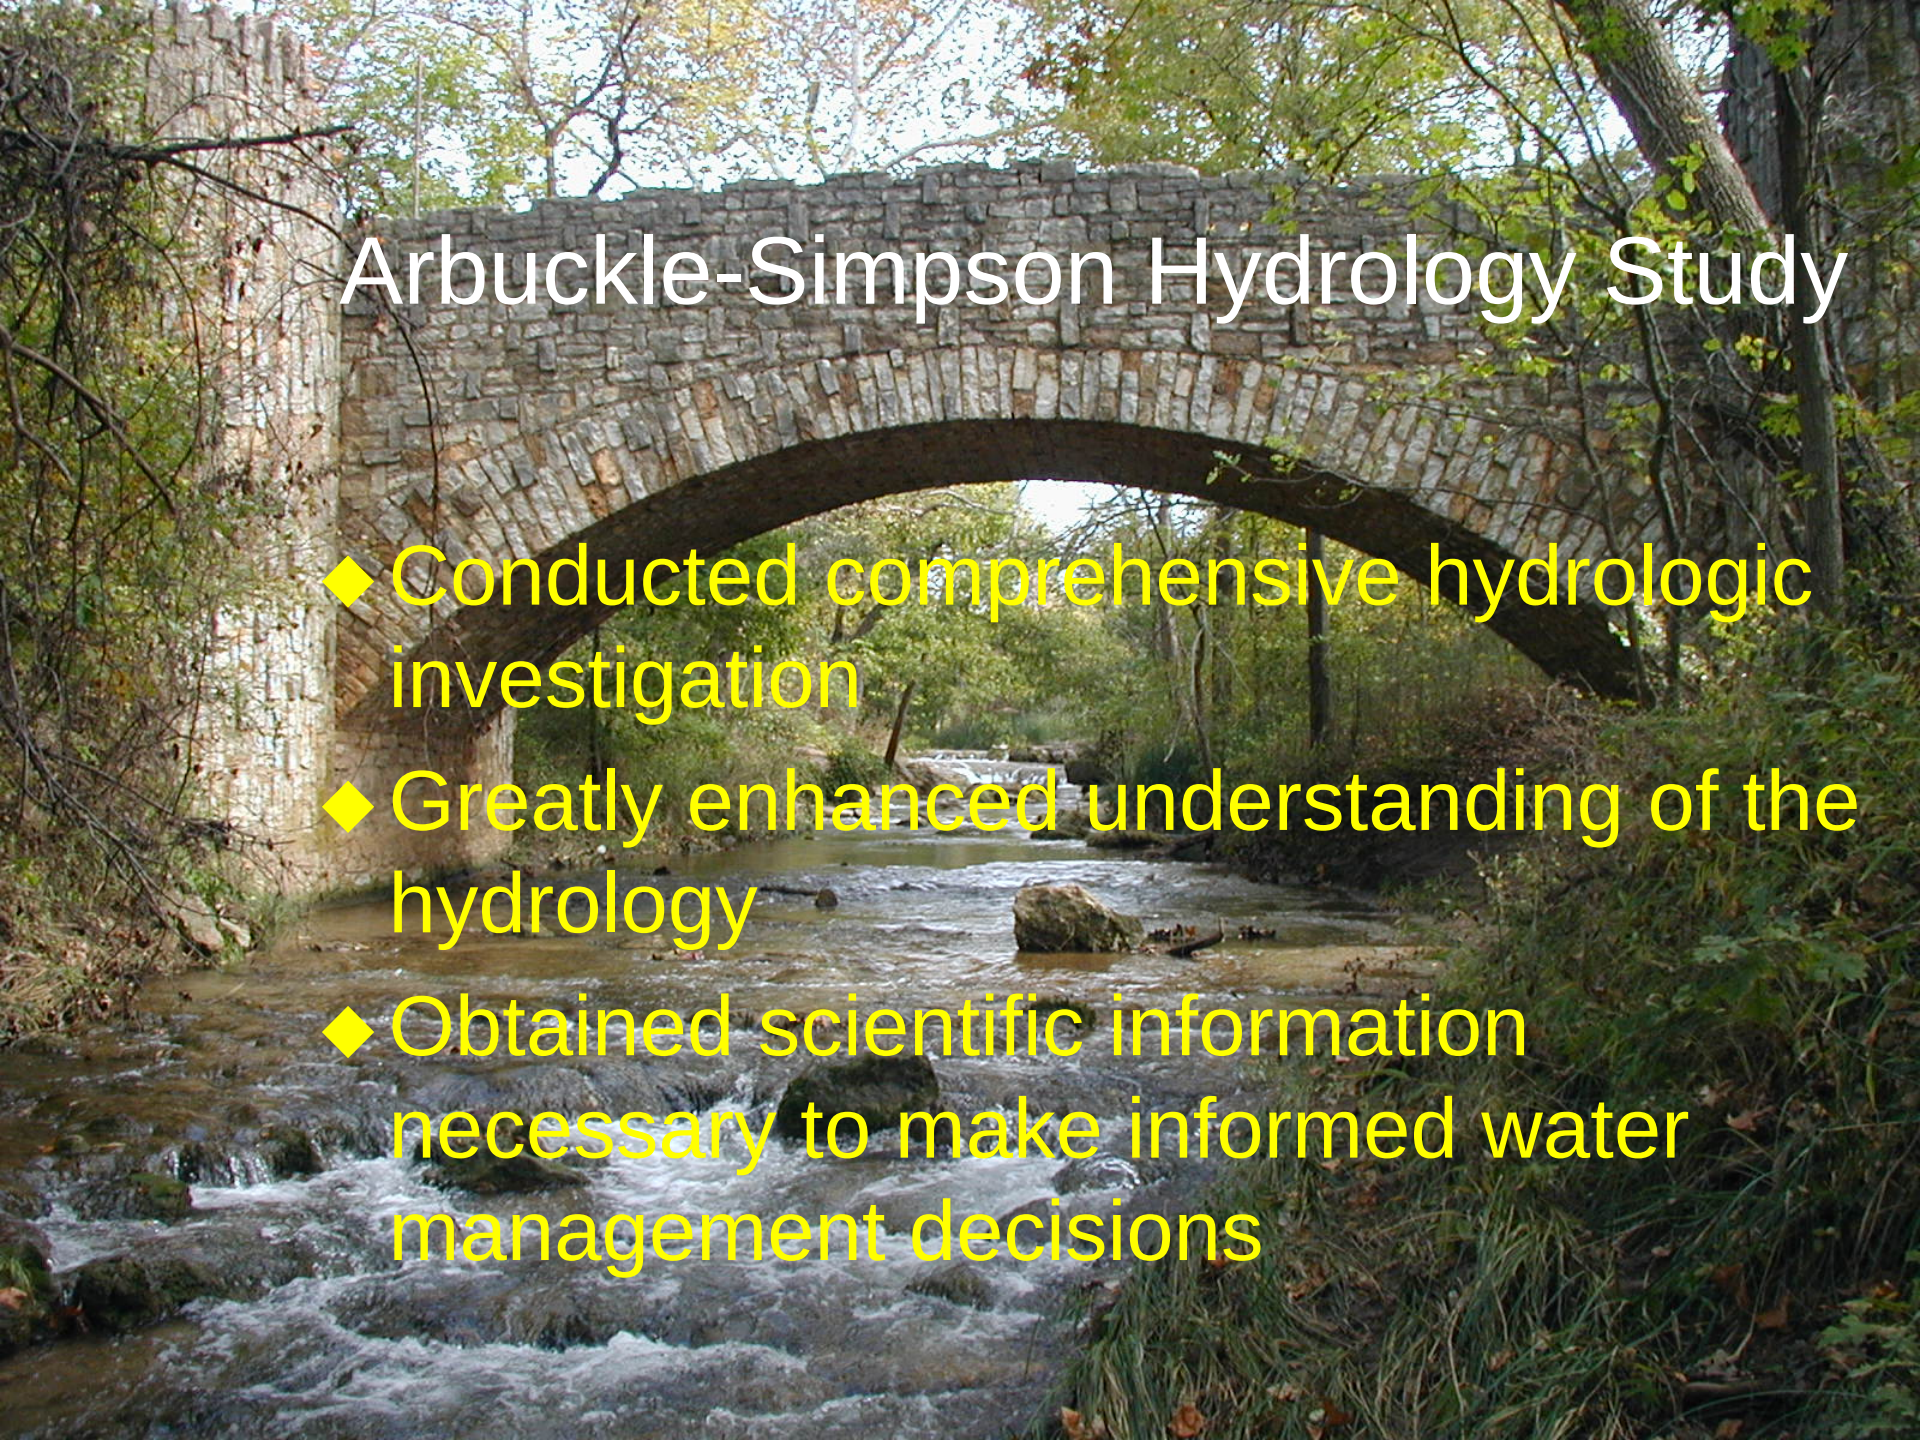
Precipitation Departure from 5-year Threshold

- Droughts most common 1700-1770 and 1900-1960.
- Worst drought in instrumental record 1910-11 (1.6% recurrence).
- Droughts of 1950s rank high (3.3% recurrence).



Hydroclimatic Reconstruction Conclusions

- Multi-decadal droughts are rare.
- Droughts lasting 2 or more years occur about once every 20 years.
- Droughts lasting 1 year are most common.
- Recurrence intervals of severe droughts are relatively low.
- Period of study is representative of the last 300 years.



Arbuckle-Simpson Hydrology Study

- Conducted comprehensive hydrologic investigation
- Greatly enhanced understanding of the hydrology
- Obtained scientific information necessary to make informed water management decisions
