Executive Summary

The Central Oklahoma Master Conservancy District (COMCD), in cooperation with the City of Midwest City (MWC), manufactured and ran drinking water pilot plants to screen the methods of hydrogen peroxide and EarthTec® pretreatment to Lake Thunderbird raw water. The purpose of the project was to determine the effectiveness of the two pretreatment options ability to improve raw water quality, enhancing municipalities' ability to better serve their customers. Two separate pilot plants were constructed: one tested EarthTec® as an in-lake treatment option and the other tested concentrated hydrogen peroxide as a pretreatment in the raw water transmission line. Tests were run from June 19, 2003 through November 4, 2003. Screening criteria were as follows: reductions of target parameters would pass pilot plant screening while methods shown to be ineffective in reducing target parameters would not pass screening. Primary test parameters were total organic carbon (TOC) and taste and odor number (TON). Secondary parameters important to the process included trihalomethane formation potential (THMFP), haloacetic acids (HAA) and UV254.

Statistical tests were run comparing raw water against both pilot plants to minimize environmental and temporal influence. Test results showed that EarthTec® was not effective at reducing primary test parameters, secondary test parameters or chlorophyll-a. However, the peroxide pilot plant did show significant reduction of TOC, THMFP and UV254. When compared against the Midwest City water treatment plant process (through clarification and filtration), hydrogen peroxide treatment showed enhanced removal of TON, TOC, HAA and UV254 ([Table 1](#)).

Test Parameter (unit)	EarthTec® sample site 1 vs sample site 3	Hydrogen Peroxide sample site 2 vs sample site 4
	↑ or ↓	↑ or ↓
TON (number)	↑	↓
TOC (mg/L)	NA	↓
HAA (mg/L)	NA	↓
THMFP (mg/L)	↑	NA
UV254 (cm-1)	↑	↓

Table 1: Screening results for the EarthTec® and hydrogen peroxide pilot plants. The arrow represents the direction of change due to pilot plant treatment. NA – no significant change

Recommendations

- EarthTec® may not be an effective pretreatment option for Lake Thunderbird raw water and does not warrant further investigation.
- Significant reduction of TOC, THMFP and UV254 were observed with application of hydrogen peroxide and warrants further investigation.
- Hydrogen peroxide pretreatment enhanced the Midwest City water treatment process train's ability to reduce TON, TOC, HAA and UV254 and warrants further investigation.

Introduction

The Oklahoma Water Resources Board (OWRB) had been requested to support pilot plant testing directed by the Central Oklahoma Master Conservancy District (COMCD). The purpose of the project was to evaluate pre-treatment options to improve raw water quality and enhance the ability of municipalities to serve their customers. Study results will be used to aid COMCD decision making for further investigation. The staff of the City of Midwest City (MWC) water treatment plant (WTP) manufactured and ran pilot plants to show the effects of applying concentrations of hydrogen peroxide and EarthTec® to diverted Lake Thunderbird raw water as a pretreatment measure. Tests were run from June 19, 2003 through November 4, 2003. The OWRB ensured laboratory analysis of the pilot plant samples, provided concurrence between parties for proposed actions, compiled laboratory data and drafted a technical evaluation of the pilot plant studies. For this study, the COMCD suspended the application of free chlorine to the raw water supply during the testing period.

A description of the raw water delivery system and pilot plant designs are given. Following details of the pilot plant design are discussions of the test parameters, statistical procedures used to evaluate pilot plant results, pilot plant results, summary and finally recommendations.

Raw Water Delivery System

The COMCD furnishes Lake Thunderbird water to the City of Norman, Del City and Midwest City to be processed into potable water through a series of pipes and pump stations originating from Lake Thunderbird. The COMCD's raw water pumping plant is located on the north shore of Lake Thunderbird adjacent to their water quality sample site 4. Raw water is routed directly to Norman from the pumping plant while a separate line delivers raw water to a relift station prior to routing to Midwest City and Del City.

Del City and Midwest City share a raw water conveyance line to a one million gallon open top holding tank at a relift station located 12.5 miles north of the lake ([Figure 1](#)). From the relift station, raw water is routed 3.6 miles to the Midwest City water treatment plant. Located on the plant grounds are two regulating tanks capable of holding 2.383 million gallons of raw water. From the regulating tanks, the water flows into "Tucker's Vault" and then proceeds into the plant train for processing. [Table 2](#) summarizes detention times at several flow rates in the MWC WTP. A seven million gallon (7 MG) flow rate and fifteen-hour (15 hr) total detention time were used for the pilot plant design because they most closely approximate the raw water conveyance summer operating conditions.

	4 MG Flow	7 MG Flow	13 MG Flow
Lake to Relift	20.16	11.52	6.2
Relift	2.8	1.6	0.87
Relift to Plant	4.2	2.4	1.3
Total Detention	27.16	15.52	8.37

Table 2: Detention times (hours) from Lake Thunderbird to MWC WTP

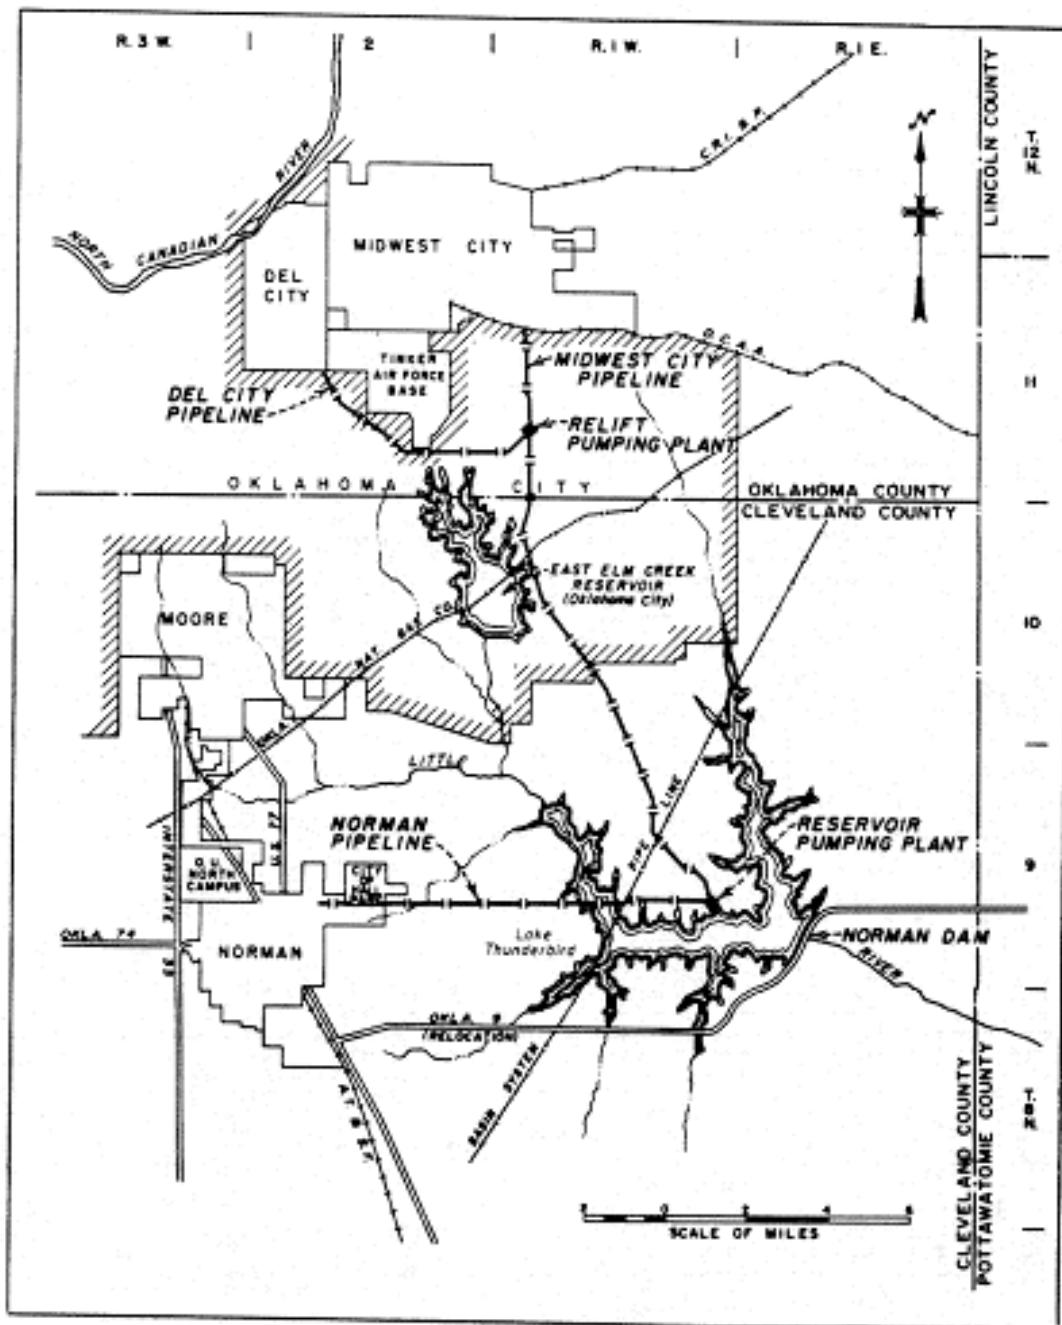

Figure 1: Diagram showing COMCD Lake Thunderbird pumping plant and network of transmission lines to municipal treatment plants.

Pilot Plant Design

Hydrogen Peroxide

The hydrogen peroxide (H_2O_2) pretreatment was tested on a small-scale pilot plant based on the MWC WTP train #2. The pilot plant consisted of the following structures:

1. A ten-inch by ten-foot (10" x 10') section of PVC pipe was used to simulate the COMCD transmission line. The PVC pipe was capped on each end and retrofitted on one end with injection points for hydrogen peroxide and ferric sulfate. Detention time in the pipe was 5.4 hours.
2. A regulating tank.
3. Pre-treatment basin
4. A flash mixer with a variable speed mixer.
5. A contact basin with a variable speed mixer.
6. Four filters.
 - a. Filter 1: 50% lignite and 50% anthracite
 - b. Filter 2: 50% bituminous and 50% anthracite
 - c. Filter 3: 100% anthracite
 - d. Filter 4: 25% lignite and 75% anthracite

To ensure accuracy of testing, the required detention times in each structure of the pilot plant were calculated to match detention times in the main plant. Equation 1 was used to calculate the required detention time of each pilot plant component. Volumes and detention times for each structure in the pilot plant are contained in [Table 3](#).

$$\text{Equation 1: Detention time (minutes)} = \frac{\text{container capacity (gallons)} \times 3785 \text{ mL/gallons}}{\text{Flow}}$$

	Regulating Tank	Pre-treatment Basin	Flash Mixer	Contact Basin	Filters
Tank size (inches)	30" x 20.5"	15.75"	Insignificant	18.75" x 22"	N/A
Tank volume (gallons)	51.74	9.8	Insignificant	30.85	N/A
Detention Time	6.9 hours	1.3 hours	4.94 minutes	4.1 hours	0.133 hours

Table 3: H_2O_2 plant detention times at 473 mL/min flow

Earthtec®

EarthTec® was applied to a 1,500 gallon tank which was used to mimic the lake. EarthTec® treated water was routed to a 10'long 10" diameter PVC pipe capped at the end and fitted with a valve for withdrawal of samples. The EarthTec® pilot plant was operated with a detention time of 5.4 hours and flow of 473 ml/min.

Chemicals and Application Points

To determine the effect of the pre-treatment options, only the pre-treatment chemicals were varied (hydrogen peroxide, ferric sulfate, and Earthtec[®]). Ferric sulfate was used because it is a good coagulant and a good catalyst (e.g. Fenton's Reagent) when using hydrogen peroxide. Other chemicals used on a daily basis included: chlorine dioxide, chlorine, and two types of polymers.

In the hydrogen peroxide pilot plant, ferric sulfate and hydrogen peroxide were applied to the raw water in the ten-inch pipe. The water flowed through the regulating tank to the flashmixer where polymer and chlorine dioxide were applied. The water then entered the contact basin and chlorine was applied. After leaving the contact basin, the water flowed to the four filters.

Sample Sites

Figure 2 shows the location of the four sample sites.

1. Sample #1: Raw water with no treatment. This sample was collected from a laboratory faucet in direct connection to Tucker's vault.
2. Sample #2: MWC filtered (full scale plant). This sample was collected from a faucet inside the water treatment plant that is connected to the post conventional treatment waterline.
3. Sample #3: Raw water with Earthtec[®]. This sample represents lake pretreatment.
4. Sample #4: MWC filtered with hydrogen peroxide pre treatment (pilot plant). This sample represents pretreatment of raw water with peroxide followed by conventional water treatment.

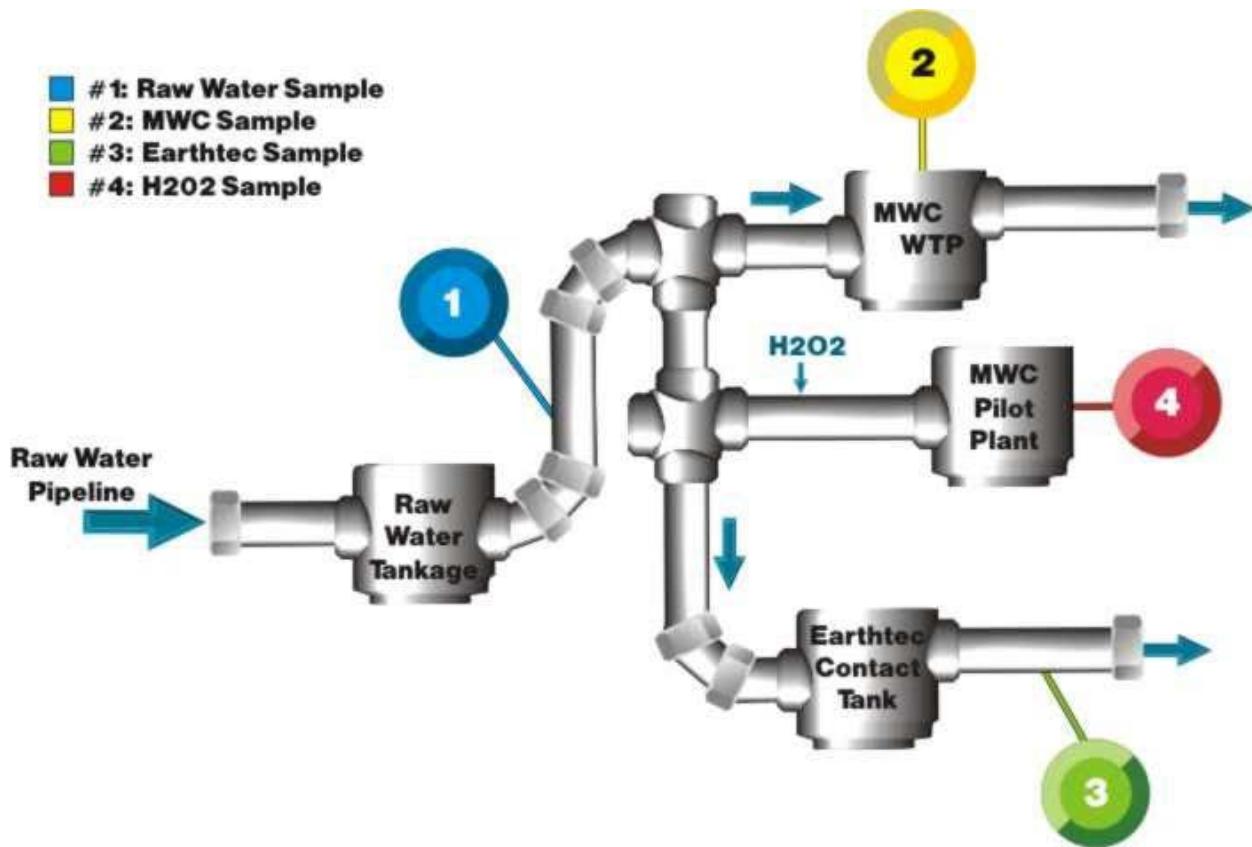

Figure 2: Pilot plant schematic with sample sites. **Note:** This study did not involve finished water in anyway.

Test Parameter Discussion

Pilot plant water quality parameters were selected using input from COMCD board members and staff from the Cities of Norman, Del City and Midwest City. As directed by the COMCD, the OWRB contracted all pilot plant analysis to one laboratory, Accurate Labs of Stillwater, OK. Sample procedures followed were those prescribed by Accurate Labs designed to follow standard sampling methods. [Table 4](#) details sampling requirements and analytical methodology. A brief discussion of each pilot plant test parameter is given to familiarize the reader and help with interpretation of test results.

Analysis	Container	Hold Time
Total organic carbon by SM 5310C	1-40ml vial (H3PO4)	28 days
Trihalomethane formation potential by EPA 524	3-40ml vial (no headspace)	14 days
Algae counts by SM10200i	1-1Liter amber glass	none noted
Total copper by EPA 200.7	1-500ml plastic (HNO3)	6 months
Threshold odor number by SM 2150B	1-1Liter glass	ASAP
Geosmin/ MIB by EPA 6040	2-60ml amber vials (HgCl2) (no headspace)	14 days
Haloacetic acid by EPA 522	3-60ml amber vials (NH4Cl) (no headspace)	14 days
UV 254 by SM5910b	1-40ml amber vial	48 hours

Table 4: Summary of laboratory analytical methods and sampling requirements for pilot plant samples.

Chlorophyll-a is a direct measure of living algae. Chlorophyll-a has a very short life outside of living cells and is rapidly converted to pheophytin-a upon cell death. Chlorophyll-a is a measure of raw water quality and viewed as an indicator of raw water quality and organic content.

Taste and Odor Number (TON) is a value derived from human ability to detect objectionable smells. Values are reported as integer numbers and generally applied to finished drinking water. A value of 3 or more is considered objectionable.

Total Organic Carbon (TOC) serves as a direct measure of organic content. TOC, a required monitoring parameter for water treatment plants, does not differentiate between dissolved and particulate fractions.

Haloacetic Acid (HAA) analysis is a required monitoring parameter in the finished water distribution system. Haloacetic acids represent a class of halogenated two-carbon organic compounds representing a potential threat to human health. Chlorine, bromine and iodine are the more common halogens.

Trihalomethane Formation Potential (THMFP) analysis serves as an indicator of the potential for trihalomethane (THM) to form in a chlorinated finished water distribution system. Although not a required monitoring parameter for water distribution systems this parameter is a useful predictor.

Ultraviolet absorption at 254 nm (UV254) indicates the total concentration of UV-absorbing organic compounds in drinking water. This parameter is unitless as it reports the absorption of ultraviolet light at 254-nanometer wavelength of the filtered sample. It can be utilized to correlate the dissolved organic carbon content of the sample.

Geosmin, detectable to the human palate above 4 ng/L, is a known taste and odor causing chemical sometimes found in drinking water. Certain species of algae are known to produce this chemical. Cell death is usually responsible for the release of this compound from the algae into the water column and subsequent objectionable taste and odor.

2-Methylisoborneol (MIB) is another taste and odor chemical detectable to the human palate at low concentrations. Certain species of algae are known to produce this chemical. Cell death is usually responsible for the release of this compound from the algae into the water column and subsequent objectionable taste and odor.

Copper is a metal and known toxicant to plant and invertebrate life. Copper is the stated active ingredient in the aquatic herbicide, EarthTec®. Copper above 1 mg/L in drinking water can cause undesirable taste and color issues.

Statistical Procedures

A battery of statistical tests was applied to the pilot plant water quality data. The first round of tests established the statistical distribution for each parameter by sample site. Results showed the majority of parameters results were (statistically) non-normal. Several reasons can explain a non-normal distribution including small sample size, narrow range of data reports and many reports below detection limits. These facts do not degrade the value of the data but serve to lead the investigator towards appropriate test methods. Because most of the data were non-normal, non-parametric test procedures were used to ensure the validity of pilot plant results.

The Kruskal-Wallis test packaged in Minitab® software was chosen for the bulk of analysis. In short, the Kruskal-Wallis test looks for differences between medians. Median is a non-normal measure of central tendency just as average is a normal measure of central tendency but average assumes a normal distribution. When data is normally distributed the average and median are the same value. When distributions are not normally distributed the average value will be biased by extreme values. Median on the other hand is the middle observation in a data

set and represents the place in the distribution where half the values in the set are greater than and half the values less than the median value. An additional advantage of the Kruskal-Wallis (against median) test statistic is the ability to conclude major effects possibly obscured by the wide range of pilot plant settings used over the entire data set. The Kruskal-Wallis hypotheses are:

- H0: the population medians are all equal versus
- H1: the medians are not all equal

Finally the packaged Minitab software reports all results to the user as a p-value or probability of a false conclusion. In the case of pilot plant results, p-values less than 0.10 allow for the test hypothesis to be rejected and conclude significant differences for that parameter. For this report, differences concluding that the pilot plant treatment significantly affected the laboratory parameter have been bolded for ease of interpretation followed by a percent change between median values. A positive % change represents a pilot plant increase while a negative value represents a pilot plant decrease. The last value given from this statistical testing is the median value for the particular pilot plant treatment. An assumption for this test is that the samples from the different populations are independent random samples from continuous distributions, with the distributions having the same shape. Based on these basic statistical test results, general conclusions for each pilot plant parameter are drawn to point towards a recommendation regarding each tested pilot methodology.

Additional presentation of test pilot plant results and statistical evaluation are given for pilot plant methods recommended for additional investigation. Optimal plant settings (as bracketed by the input range) are given. Additional statistical evaluation was also performed on the results of the recommended pilot plant method. These tests were to determine primary factors affecting response parameters such as TOC, UV 254 and TON.

Results

Presentation of test results has been segregated to characterize the following processes:

- EarthTec® pretreatment of Lake Thunderbird water with accompanying conveyance system retention
- Enhanced hydrogen peroxide pretreatment of diverted raw water from Lake Thunderbird within the conveyance system

All laboratory test results have been compiled and are presented in [Appendix A](#). [Appendix A](#) also includes quality assurance and quality control reports and a statement of detection limits for all parameters.

EarthTec® Pretreatment

Sample site 1 was compared against sample site 3 to screen the effectiveness of the Earthtec® pilot plant ([Figure 2](#)). A statistical reduction of MIB was noted while no statistical change was noted for TOC, HAA, and geosmin ([Table 5](#)). Chlorophyll-a, TON, THMFP, UV254 and copper showed a statistically significant increase. The increase of dissolved organic carbon as reflected through UV254, THMFP and TON could be expected through release of algae cell contents. The increase of copper, the active ingredient of the algaecide EarthTec®, was a predictable conclusion. EarthTec® pretreatment was not effective at reducing primary or secondary test parameters.

Test Parameter (unit)	EarthTec®				
	Median Value	p-value	Median Change	Range	↑↓
Chl-a (µg/L)	1750	0.043	386%	-54% to 12,458%	↑
TON (number)	0.5	0.032	0%	0% to 100%	↑
TOC (mg/L)	5.80	0.271	7%	0% to 32%	—
HAA (mg/L)	2	0.547	0%	0% to 278%	—
THMFP (mg/L)	626	0.083	12%	-8% to 69%	↑
UV254 (cm-1)	0.0860	0.022	12%	1% to 29%	↑
Geosmin (ng/L)	1.50	0.745	0%	-46% to 247%	—
MIB (ng/L)	1.50	0.054	-59%	-95% to 0%	↓
Cu (mg/L)	0.090	0.000	1019%	167% to 7,500%	↑

Table 5: Statistical comparison of EarthTec® pilot plant treated water against raw water. Bolded numbers represent statistical significance between treatments as indicated by the p-value while the arrow represents the direction of change due to pilot plant treatment. Median change represents the percent reduction between treatment medians.

Peroxide Treatment

For the first statistical comparison, raw water was compared against the peroxide pretreated pilot plant water; in effect comparing the results from sample site 4 to sample site 1 ([Figure 2](#)). Peroxide treatment resulted in significant reductions of chlorophyll-a, TOC, THMFP and UV254. Conversely, significant increases of TON and HAA were noted ([Table 6](#)). These increases are likely attributed to the application of chlorine dioxide and free chlorine in the pilot plant train. No significant changes were noted for the taste and odor chemicals geosmin and MIB. The removal of chlorophyll-a shows elimination of algae cells by the pilot plant. However the TON and HAA enhancement suggests that although the cells are eliminated the contents are not. The reduction of UV 254 shows removal of dissolved organic compounds while TOC shows a moderate reduction of total organic compounds.

For the second statistical comparison, raw water was compared against Midwest City's full-scale treatment system, in effect comparing the results from sample site 2 to sample site 1 ([Figure 2](#)). This allowed for a brief assessment of conventional treatment without the peroxide enhancement. Significant reductions were noticed for chlorophyll-a and UV254. Conversely, significant enhancements were noted for TON and HAA. No significant changes were noted with TOC, THMFP, geosmin, or MIB concentration. The removal of chlorophyll-a shows removal of algae cells from the raw water. However, the TON and HAA enhancement combined with the lack of significant reduction of TOC suggests that although the cells are eliminated the contents are not. The reduction of UV 254 shows some removal of dissolved organic compounds.

The third and final comparison was to estimate the effect of peroxide enhancement by subtracting MWC median reports from peroxide median reports using data from [Table 6](#). Hydrogen peroxide pretreatment provided enhanced removal of TON, TOC, HAA, MIB and UV254 compared against MWC ([Table 7](#)).

Test Parameter	Raw Water vs. Peroxide				Raw Water vs. MWC			
	Median Value	p-value	Median Change	Range	Median Value	p-value	Median Change	Range
Chl-a ($\mu\text{g/L}$)	0.5	0.000	-100%	-100% to -81%	0.5	0.000	-100%	-100
TON (number)	1.2	0.000	240%	-100% to 700%	4.0	0.000	700%	300% to 1,600%
TOC (mg/L)	4.5	0.014	-17%	-53% to 5%	5.3	0.643	-4%	-12% to 2%
HAA (mg/L)	49.5	0.000	2478%	940% to 12,600%	94	0.000	4,598%	3,175% to 7,800%
THMFP (mg/L)	423	0.009	-6%	-71% to 14%	523	0.862	-6%	-20% to 6%
UV254 (cm ⁻¹)	0.0465	0.000	-40%	-67% to -26%	0.0495	0.000	-35%	-52% to 33%
Geosmin (ng/L)	1.5	0.547	0%	-84% to 25%	1.5	0.324	0%	-13% to 1,300%
MIB (ng/L)	1.5	0.439	59%	-85% to 86%	6.5	0.585	76%	-77% to 393%

Table 6: Statistical comparison of raw water against the peroxide pilot plant (prior to disinfection) water (Raw Water vs. Peroxide) and raw water against MWC treated water prior to disinfection (Raw Water vs. MWC). Bolded numbers represent statistical significance between treatments as indicated by the p-value. Median change represents the percent reduction between treatment medians.

Test Parameter (unit)	Difference between Medians	Difference between Median % Reduction	Direction of Change
Chl-a ($\mu\text{g/L}$)	0	0%	—
TON (number)	2.8	60%	↓
TOC (mg/L)	0.8	13%	↓
HAA (mg/L)	44.5	2,120%	↓
THMFP (mg/L)	100	0%	—
UV254 (cm ⁻¹)	0.0030	5%	↓
Geosmin (ng/L)	0.0	0%	—
MIB (ng/L)	5.0	17%	↓

Table 7: Net removal by peroxide pilot plant as compared against MWC plant performance.

Peroxide Plant Settings

The ability of the peroxide pilot plant to enhance performance warranted additional evaluation as to what settings produced the best water. Midwest City Water Treatment Plant staff varied settings as testing progressed in order to approach best performance. Using measures of organic carbon (TOC) as the most important parameter, the settings on 09/30/03 showed a 51 % reduction of TOC, the highest to date ([Table 8](#)).

Peroxide Pilot Plant Treatment										
Date	Feed Rate Settings (ppm)					Parameter Test Results (Removal Rates)				
	Ferric	POLYMER		H_2O_2	Cl_2	ClO_2	TOC	UV254	HAA	THMFP
		9311/2202	8809/4202				(mg/L)	(cm-1)	(mg/L)	(mg/L)
07/01/03	25.0	10.0		0.5	5.0	0.0	27%	45%	-3085%	47%
07/22/03	25.0	10.0		0.5	5.0	1.5	-4%	47%	-3065%	38%
08/05/03	25.0		10.0	0.5	5.0	1.5	24%	37%	-940%	13%
08/12/03	25.0		10.0	3.0	5.0	1.5	6%	26%	-1485%	11%
08/19/03	25.0	10.0		10.0	5.0	1.5	28%	48%	-1605%	29%
08/26/03	25.0	10.0		20.0	7.0	1.5	20%	40%	-1040%	21%
09/02/03	0	10.0		20.0	7.0	0.0	-5%	32%	-12600%	11%
09/09/03	0	10.0		1.0	7.0	1.5	15%	36%	-2510%	27%
09/16/03	20.0	8.0		30.0	7.0	1.5	18%	38%	-2285%	10%
09/23/03	30.0	8.0		30.0	7.0	1.5	53%	67%	-1055%	71%
09/30/03	40.0	8.0		30.0	7.0	1.5	9%	40%	-2465%	23%

Table 8: Experimental Design of Peroxide Pilot Plant with laboratory test results presented as percent reduction from raw water.

Peroxide Feed Rate

Plots of peroxide feed rate versus averaged test parameters were prepared to seek potential relationships between peroxide feed rate and removal of organic constituents. Simple plotting of all applicable parameters was performed encompassing six peroxide feed rates ranging from 0.5 ppm to 30 ppm. It is important to note that while peroxide feed rate was varied, other pilot plant settings were also varied. [Table 8](#) summarizes the experimental design for the first set of pilot plant tests. Three additional tests were performed after September 30, 2003 varying only peroxide feed rate. Combined with the pre-September 30, 2003 tests, a total of 4 tests with two different feed rates were performed under controlled conditions. Preliminary plots of these four tests and two feed rates were not instructive.

To provide an overview of parameter response to peroxide feed rate the entire data of 14 test dates were used. Data was transformed to reduce the influence of seasonal variation and grouped averages used to minimize but not eliminate bias. As in previous analysis the first transformation was to calculate the difference between raw water content and peroxide enhanced conventional treatment. These results were then grouped by feed rate to yield groups with sample sizes of 2 to 3 and plots constructed of average percent removal level (raw water against peroxide treatment) for various feed rate settings. These plots should not be considered diagnostic but indicative.

Generally increasing feed rate increased the percent removal of TOC ([Figure 3](#)). The lowest setting of 0.5 ppm showed an average of 16% removal while the 1-3 ppm setting had the lowest average removal rate of 3%. From here average removal percentages increased up to an average removal of 29% at 30-ppm feed rate. While TOC showed increasing removal with increasing feed rate, TON did not provide a consistent picture of dose response ([Figure 4](#)). Both the 5-ppm and 20-ppm showed 0% reduction of TON, all other feed settings indicated an enhancement of TON. Generally increasing feed rate increased the percent removal of THMFP ([Figure 5](#)). The lowest setting of 0.5 ppm showed an average of 36% removal while the 1-3 ppm setting had the lowest average removal rate of 7%. From here average removal percentages

generally increased up to an average removal of 27% at 30 ppm feed rate. In general HAA was elevated by treatment ([Figure 6](#)). The highest magnitude was noted at the two lowest feed rates with the smallest increase of HAA occurring at the 5 ppm feed rate. The last parameter examined was UV254. With the exception of the 5ppm fed rate category, the average percent removal of UV254 increased with increasing feed rate ([Figure 7](#)).

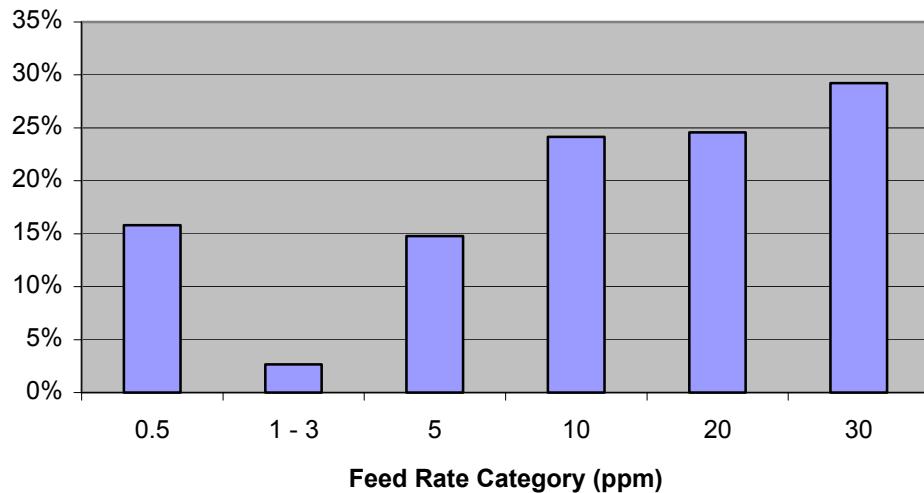

Figure 3: Hydrogen Peroxide feed rate on average TOC % reduction

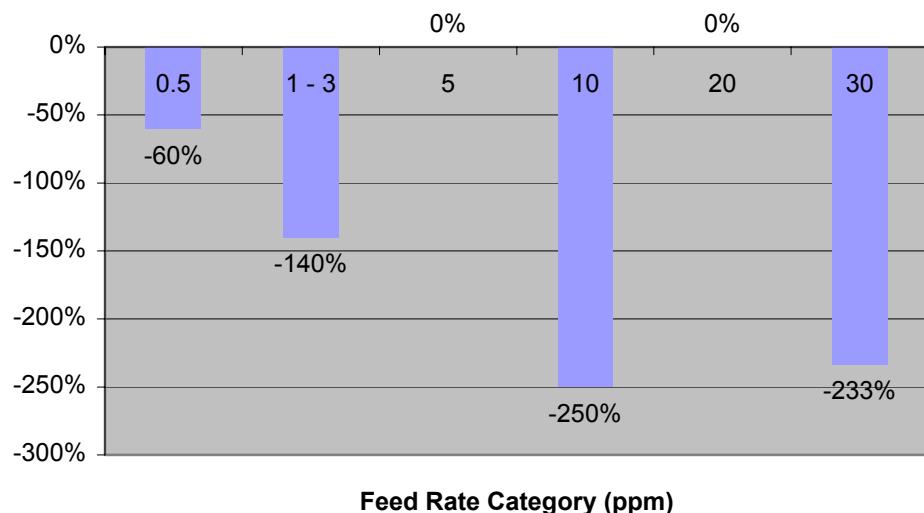

Figure 4: Hydrogen Peroxide feed rate on average TON % reduction

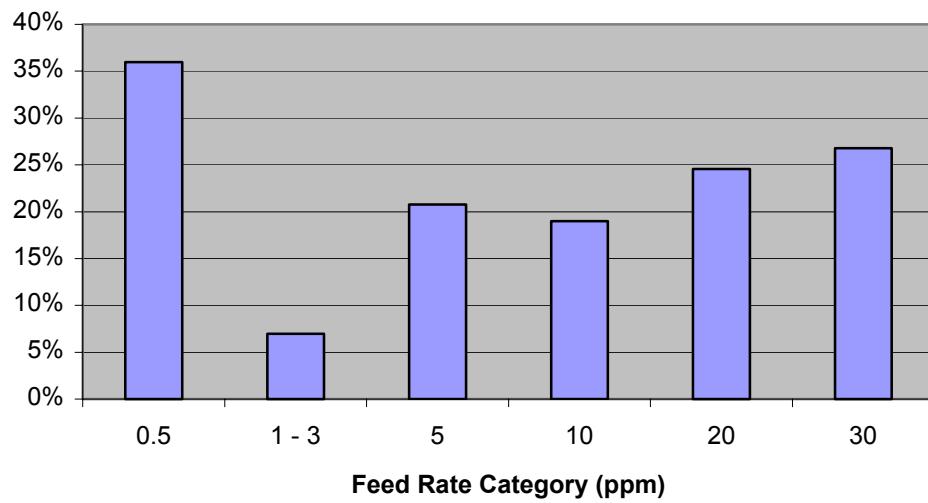

Figure 5: Hydrogen Peroxide feed rate on average THMFP % reduction

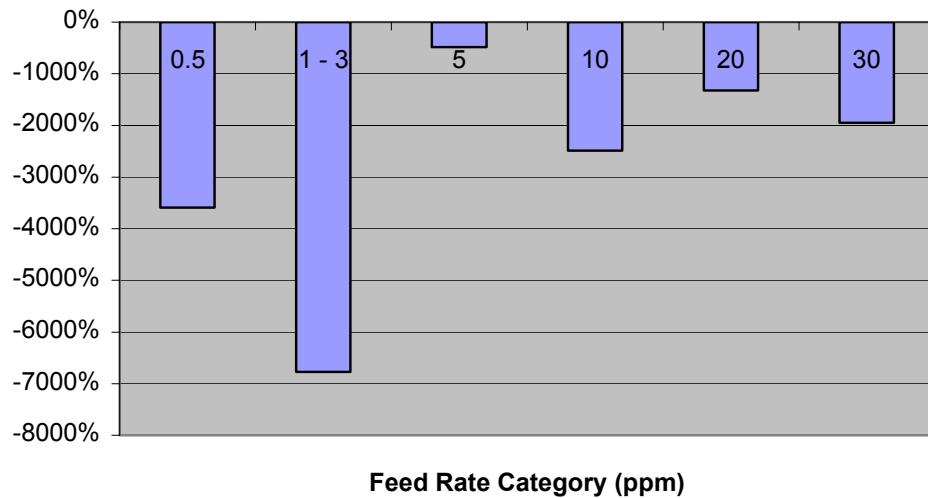

Figure 6: Hydrogen Peroxide feed rate on average HAA % reduction

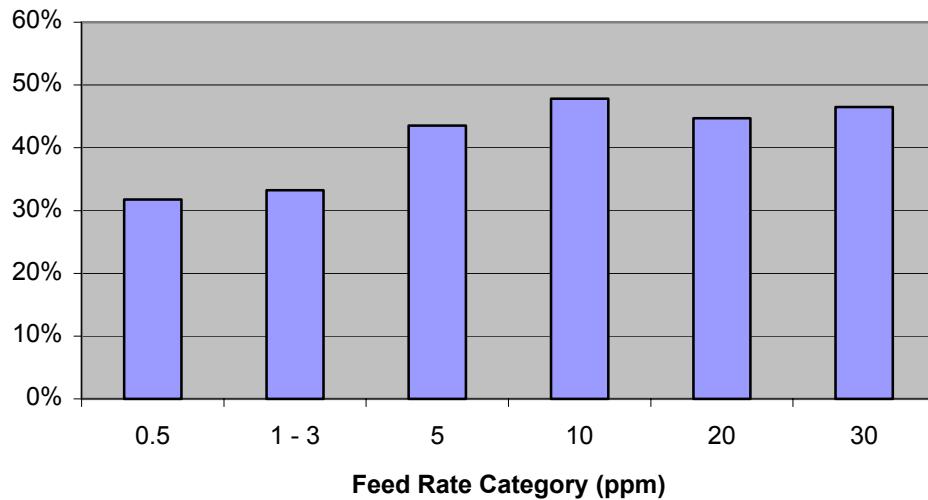

Figure 7: Hydrogen Peroxide feed rate on average UV254 %reduction

Detention Time

The effect of detention time on the hydrogen peroxide pilot plant was also examined. Four tests were available; 8/19/03, 10/09/03, 10/23/03 and 11/04/03. Percent reductions were calculated by subtracting the raw water value from the peroxide enhanced treatment value and plotting the results against detention time for the parameters of TOC, THMFP, HAA and UV254. TOC, THMFP and UV 254 showed the greatest reduction with a 5-hour detention time ([Figures 8, 9, and 10](#)). UV254 seemed to maintain about a 50% reduction independent of detention time.

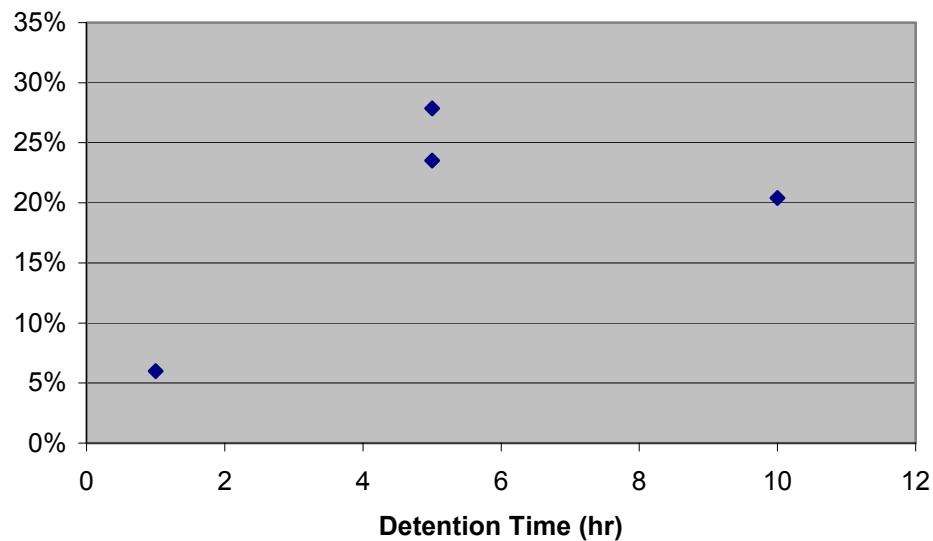

Figure 8: Percent reduction of TOC with variable detention time

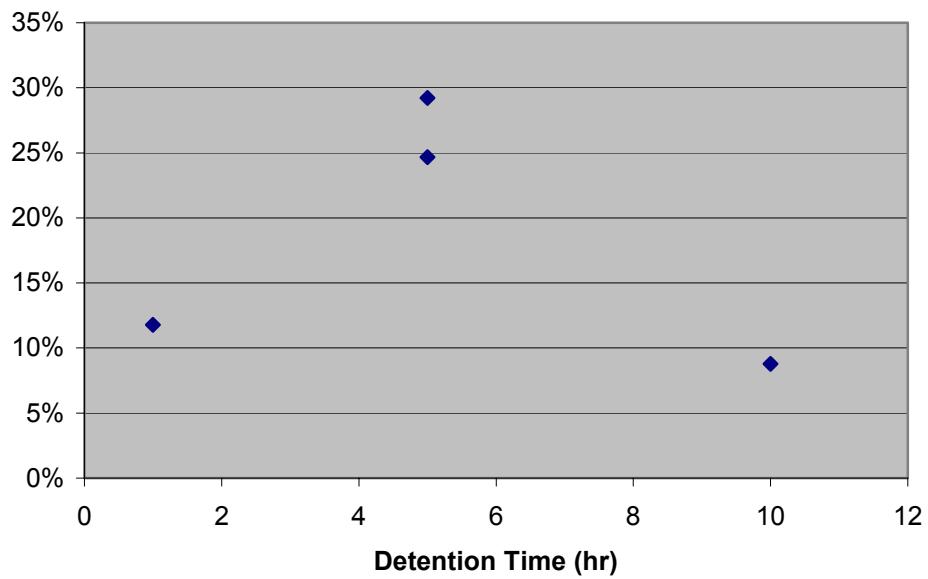

Figure 9: Percent reduction of THMFP with variable detention time

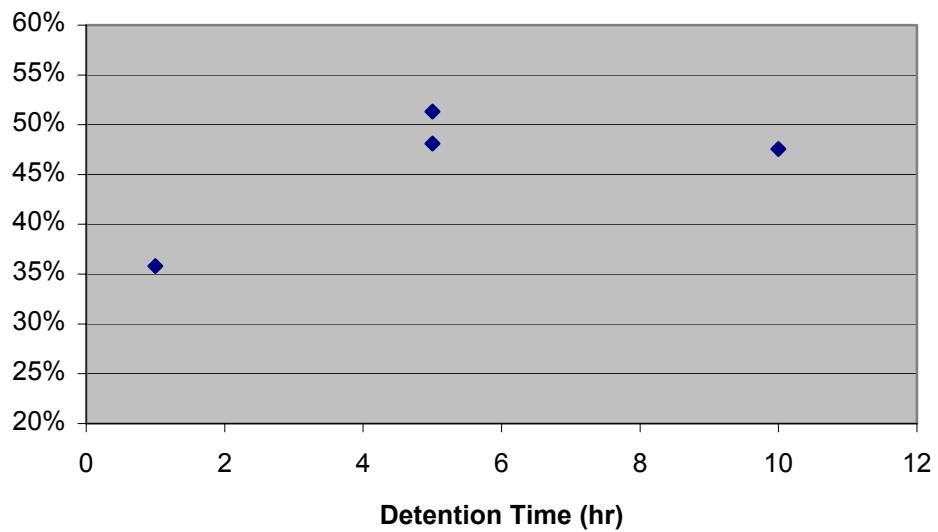

Figure 10: Percent reduction of UV254 with variable detention time

Summary

Two pilot plants were constructed and run for the purpose of screening raw water pretreatment options. Tests were run from June 19, 2003 through November 4, 2003. Samples were analyzed by a contract laboratory, reported to the OWRB, compiled and used for screening. Test data was examined for reduction of primary and secondary parameters by each pilot plant.

EarthTec® was not effective at reducing primary measures of organic content such as TOC and TON, or chlorophyll-a concentrations. However, the algaecide seemed effective at reducing MIB. Significant reduction of the target parameters: TOC, THMFP and UV254 were noted for the peroxide pilot plant.

Hydrogen peroxide treatment provided enhanced removal of TON, TOC, HAA and UV254 compared against the MWC water treatment plant process (through clarification and filtration). Examination of variable feed rate indicated increasing TOC removal with increasing feed rate. Detention time data indicated peak TOC removal percentage at the 5-hour detention time. Feed rate and detention time data however, were not as conclusive for TON. For the most part TON was elevated by peroxide treatment. Assessing the effect of detention time on TON was not possible because the numerous below detection limit reports precluded any calculations.

Recommendations

- EarthTec® may not be an effective pretreatment option for Lake Thunderbird raw water and does not warrant further investigation.
- Significant reduction of TOC, THMFP and UV254 were observed with application of hydrogen peroxide and warrants further investigation.
- Hydrogen peroxide pretreatment enhanced the Midwest City water treatment process train's ability to reduce TON, TOC, HAA and UV254 and warrants further investigation.

* QC Codes: C - control, D - Duplicate

Detection Limits

Parameter	PQL*
MIB	3 ng/L
Dichlorobromomethane	1.7 ug/L
Bromoform	2.0 ug/L
Chloroform	2.1 ug/L
Chlorodibromomethane	2.3 ug/L
Copper	0.002 mg/L
Dibromoacetic acid	0.4 ug/L
Geosmin	3 ng/L
Dichloroacetic acid	1.0 ug/L
Monobromoacetic acid	0.6 ug/L
Monochloroacetic acid	1.1 ug/L
Trichloroacetic acid	0.3 ug/L
Total Organic Carbon	0.2 ug/L
UV254	0.009 cm ⁻¹
Chlorophyll A	N/A

*: practical quantitation limit - the method detection limit (MDL) adjusted for any dilutions or others changes made to the sample to deal with interferences/ matrix effects. BPQL: Below Practical Quantitative Limits (if applicable)
